CKET THE LIGENCE AGENCY

Increase of manufacture from acetaldehyde

Butanol Alcohol 1000 tons 1300 " 2800 tons 2600 " 24000 tons

This amount of carbide is based on a daily production of 800 tons. There are eight ovens, of which seven are in operation; the eighth is being overhauled.

b. Present Production Program

Of the 6000 tons of acetaldehyde a month which are unreserved, 3000 tons monthly are used for reparation purposes, either as paraldehyde or cartially as alcohol. Russia prefers alcohol at present. The remaining 3000 tons monthly are used to increase the production of acetic acid, ethylene oxide and lubricating oil (SS-oil).

c. Factors

Carbide factor for Buna S formerly 4.088 now 4.3 acetic acid " 1.526 " 1.65 Vinyl chloride " 1.34 " 1.46

Caustic potash, solid, for Buna
" " vinvl chloride

.007 (Butadien drying)
.007 (acetylene drying
winvl chloride drying)

Paraldehyde for Acetaldehyde

d. New Developments and Production since 1945:

Capacities:

Palatinol C 650 tons a year increased Palatinol AH 650 tons a year reduced Vinyl Chloride 7200 tons a year "Igelitweichfolie" 240 tons a year (60% PCU, 40% Palatinol BH or AH Igelit window glass 59 " (30% PCU, 20% Palatinol BH or AH) 1800 Trichlorethylene 5000 Perchloroethylene (compulsory 250 (Process for production of production) tetrachloroethane improved) Ethylene oxide 6000 Acetic acid, techn. 11 18000 Acetate is increased to 11,000 tons a year methyl acetate 4,000 t. ethyl acetate 4,000 t. butyl acetate 3,000 t. Buna S. 20,000 tons a year Carbide 290,000 11

1.1

e. New Developments and Production since 1945:

- Isopropanol 200 tons a year
 Acetone is conducted by 300 atmosphere absolute pressure and 120° over copper or nickel catalysers
- 2) Acetates are increased to 11,000 tons a year
 Process 1945/46 periodically, from 1948 continuously. Butyl acetate
 is favored as a medium of refining.
- 3) \underline{A} 48 and \underline{A} 62 are produced as by-products of Butadien manufacture through hydrogenation of Butadian oil.
- 4) Ethylene glycol was developed in the apparatus used for glycol. The apparatus can run only alternatively either with 600 tons of glycol or 600 tons of ethylene glycol. Process: alcohol and ethyl oxide at 30 atmospheres absolute pressure and 70-80°. Important for the lacquer industry.

- 5) Brake fluid is formed as a by-product of ethylene glycol or alternatively 20 30%. Reaction product of 1 alcohol and 2 cthyl oxide 76%. 24% glycol.
- 6) Ethylic ether: Compulsory by-product of alcohol ethylene. Discovered by use of bad contacts. With good contacts as in 1948 no production of ethylic ether. Product is very impure.
- 7) Oxide wax: Capacity 120 tons a year. Process: Ethylene oxide and potassium alcoholate at normal temperature.
- 8) Triethanolamin; 120 tons a year.
 Process: Ethylene oxide and aqueous armonia at a low temperature.
- 9) Alkacid lye: 1200 tons a year.
- Paraformaldehyde solid:
 Process: concentrated formaldehyde at a high temperature in a vacuum. Manufacture resumed since the middle of 1947.
- 11) Paraldehyde (recently for Russia):
 Process: Acetaldehyde is pumped around in an "Aldoysator" (charcoal burner circulation system) with small amounts of sulphuric acid (to 3000liters of acetaldehyde, 10 liters of concentrated sulphuric acid at 20-250).
- 12) "Palatinole" and "Elaol" both new: Esterification with sulphuric acid admixture of 1%.
- Phtalopal BU: 150 tons a year.

 From 1.3 Butandiol and phthalic(acid) anhydride, one mole of each, with elimination of 1 water mole. Yield 95% of theory.

 Process: Heat approximately 20 hours until a certain acid number is attained.

 Is used as artificial r sin lacquer.
- 14) Akydal P liquid for oil varnishes mixable with pigments. 600 tons a year. Condensation product from butyl aldehyde, "Crodonaldehyd" and phthalic (acid) anhydride.
- 15) Hexamethylenetetramine
- 16) Phthalein: Manufacture again given up because of poor yield.
- 17) Chloroacetic acid, 600 tons a year.

 Is under construction. Process: trichlorethylene is saponified with 85-90% sulphuric acid at 160°.
- 18) "Diproxyd"

 Frocess: First step "Isopropanol" is converted with solid ground caustic soda or caustic potash to "Alkoholat" (fluid), cooled off (viscous) and treated in parts with carbon disulphide at a lower temperature (solid). It forms "Isopropylxanthogenat". Second step: The "Isopropylxanthogenat" is oxydized with sodium persulphate in a watery solution.
- Sapal and Emulgator II Sapal and Emulgator II Sapal is a textile, dyeing and laundry aid. Emulgator II is used for watery emulsions from mineral oils and fat oils (oil obtained from boring and spindle oil). Combined capacity 90 tons a year. Process: Butylen and propylen are polymerized with anthracite coal containing phosphoric acid to olefins C8 -C16. The olefins are converted with phenol (heated with aluminum chloride) to alkyl phenol and with ethylene oxide. Sapal has a higher, Emulgator III a lower oxide content.

SECRET/CONTROL - U.S. OFFICIALS ONLY

- 20) <u>Rubresin</u>
 Rubresin is a gum for synthetic rubber.
 Process: Ethyl phenols are boiled with formaldehyde.
- 21) Acrylic nitrite
 Ethylene oxide and hydrocyanic acid are condensed under efflux of water to
 "cyanhydrin" and heated with contact (aluminum oxide 160 250°).
 Capacity 60 tons a year.
- 22) Polystyrol PB Capacity 60 tons a year, monostyrol is polymerized (block-polymerization) at 30 120° with very small amounts of activators (benzol peroxide). The product is transparent and colorless. This is a reparations order.
- 23) Perbunan
 Acrylic nitrite is polymerized with "Butadien".

 Comment: The term "contact" as found in the text may possibly
 mean "catalyst".)
